

Project Design Phase
Proposed Solution Template

Date	01 October 2026
Team ID	SWTID-2026-1711
Project Name	Auto Ticket Classification using Flow Design
Maximum Marks	2 Marks

Proposed Solution:

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	The school IT helpdesk receives a high daily volume of incident requests (such as Wi-Fi issues, projector failures, password resets, and slow computers). Manually reviewing each request and assigning categories is time-consuming, inefficient, and creates workflow bottlenecks.
2.	Idea / Solution description	An automated ticket classification system built using ServiceNow Flow Designer. It analyzes keywords within the incident's short description and description fields to automatically assign the correct priority and category to incoming tickets.
3.	Novelty / Uniqueness	Streamlines traditional manual sorting by leveraging built-in ServiceNow Flow Designer logic and keyword analysis, transforming a routine administrative bottleneck into an instant, automated triage workflow without requiring complex, custom-coded external AI models
4.	Social Impact / Customer Satisfaction	Eliminates long resolution wait times for students and teachers, drastically reducing IT staff stress and frustration. It transforms user and staff experience from feeling overwhelmed to feeling confident and relieved through an efficient, reliable workflow.
5.	Business Model (Revenue Model)	Internal operational efficiency model (Internal IT process optimization for educational institutions), which reduces labor costs, lowers administrative overhead, and maximizes resource utilization for school IT departments.
6.	Scalability of the Solution	Highly scalable across any school district or enterprise IT helpdesk environment using ServiceNow. As ticket volumes grow, the Flow Designer logic effortlessly handles increased request loads without requiring a proportional increase in manual triage staff.
