

Project Design Phase Solution Architecture

Date	01 October 2026
Team ID	SWTID.2026-1711
Project Name	Auto Ticket Classification using Flow Design
Maximum Marks	4 Marks

Solution Architecture:

1. Technology Stack

- **Core Platform:** ServiceNow Instance
- **Key Modules:** Service Portal (for ticket submission) and Flow Designer (for backend automation).

2. Structure & Behavior

- **Trigger:** A new incident record is created via the Service Portal.
- **Data Flow:**
 - The system extracts text from the **Short Description** and **Description** fields.
 - Flow Designer evaluates keywords (e.g., "Wi-Fi", "projector", "password") using conditional logic.
 - The system automatically updates the ticket's **Category** and routes it to the correct IT group.

3. Features & Development Phases

- **Phase 1 (Setup):** Define school IT issue categories and map common keywords.
- **Phase 2 (Configuration):** Build trigger conditions and conditional decision branches in Flow Designer.
- **Phase 3 (Testing & Deployment):** Simulate test tickets to verify accuracy before activating the flow.

4. Specifications

- **Inputs:** Incident text fields (short description/description).
- **Processing:** Keyword pattern matching.
- **Outputs:** Automatically assigned ticket category, priority, and routing group.
