Customer Problem Statement

In many organizations, employees raise IT support tickets for different issues such as password resets, software problems, hardware failures, network connectivity, and access requests. These tickets are often manually reviewed and assigned to the appropriate support team. This manual process can take time, cause incorrect ticket assignments, and delay issue resolution. The customer needs a faster and more reliable way to classify and route support tickets automatically. The **Auto Ticket Classification using Flow Designer in ServiceNow** project addresses this problem by automatically identifying the type of ticket based on the submitted information and routing it to the appropriate category or support group. This helps reduce manual effort, improve ticket assignment accuracy, speed up response time, and provide customers with a smoother and more efficient IT support experience.

Example:

Problem	I am	I'm trying to	But	Because	Which makes me feel
---------	------	---------------	-----	---------	---------------------

Statement (PS)	(Customer)				
PS-1	An employee or IT support user who raises service tickets for issues such as software, hardware, network, access, and password problems.	Get my service ticket correctly classified and assigned to the appropriate support group as quickly as possible.	Tickets may require manual classification and can sometimes be assigned to the wrong category or support group, causing delays in resolving the issue.	Ticket classification and assignment are often performed manually based on the information provided by the customer.	Frustrated and uncertain because my issue may take longer to reach the right support team and get resolved.
PS-2	An IT support team member responsible for reviewing and managing incoming service tickets.	Quickly identify the type of each ticket and route it to the correct assignment group.	A large number of incoming tickets makes manual classification on time-consuming and increases the possibility of incorrect categorization or assignment.	Support teams have to review ticket details individually and determine the appropriate category and assignment group.	Overloaded and concerned about delays in ticket processing and service delivery.
